

ATAS Extended Functionality:

- Aggregated Trade
- API
- Audit Trail
- CRM
- CSA Fees

Trade Aggregation

ATAS will aggregate market side trades at the end of the day. This aggregation will be sent to the clearer overnight and will save you time and money from administration and settlement fees. Details on the aggregated trade information are visible in this view, such as brokerage, average price and net amount.

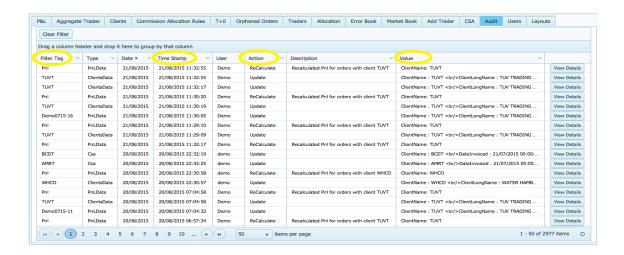

Application Programming Interface (API)

We allow API data integration via .NET and Web Service. Data will be returned as an XML.

Audit View

We provide the users with a full audit trail. Audit view enables the users to keep track of all changes in the portal. We can see where (in which page) changes were made and the period these actions were performed.

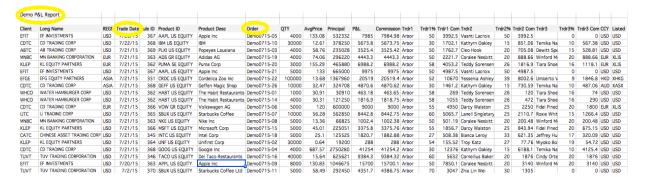

CRM Export

CRM export enables the users to export ATAS data to your preferred CRM software automatically. We can also design additional features of your preference to make client management easier.

Custom Reports

Through the export button in ATAS, you can generate XLS or CSV reports from all pages. We are also happy to offer custom reports of your preference, whether it's about P&L, allocation, aggregation, or others that the users deem as necessary.

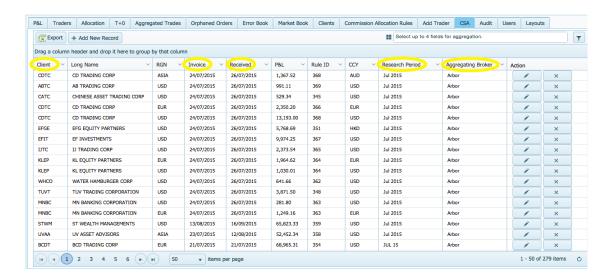

Reports can be sent to 3rd parties (clearer, admin, aggregating broker, etc) based on your preferred frequency (daily, weekly, monthly, etc).

CSA

CSA view allows the user to report and calculate fee(s) each client should pay, based on their trade activity in the research period. The users can also see the invoiced and received date. Depending on time, the users can overwrite existing CSA Records and amend it retrospectively by pressing the edit button.

CSA Reporting

If fees are outstanding for multiple research periods or across various regions, the user can use the 'group by' feature to figure the amount of outstanding fees of each client.
